## Dynamic Programing O/1 Knapsack Problem \* Informal Description: There arem in objects, which need to be stored in a Ench object 'ê' has weight 'wi' and some value Chepetit profit, size) 'vi'. We need to fend subset of objects to store such that (i) Objects have combined size of atmost W. (ii) The total benefit of the stored object is as large as possible - We cannot store parts of objects, it is the whole object or nothing. \* Formal Desomption :-and W>O, goal is to determine the subset T C {10,2,00 (of objects to stose) that maximizes & Di, rsubject to E wor & W. 1 100 and Developing a DP Algorithm for Oliknapsacle. Characterize the structure of ophimal solution: Decompose the problem Problems smaller problems.

- Construct an array V [o...n, o. .. W].
- For 1 ≤ 9 ≤ n and 0 ≤ w ≤ W the entry V[1, w] > stores the maximum benefit value of any subset of object 21,2,... 23 of wombined size at most w.

griming !

J'INDULY C

- Then the entry at V[m, will will contain the maximum benefit value of objects that can fat into the Enapsack.
- II) Recursively define the value of an ophinal
  - -> Inghal Settings: Set

V[0, w] = 0 for 0 \( \omega \o

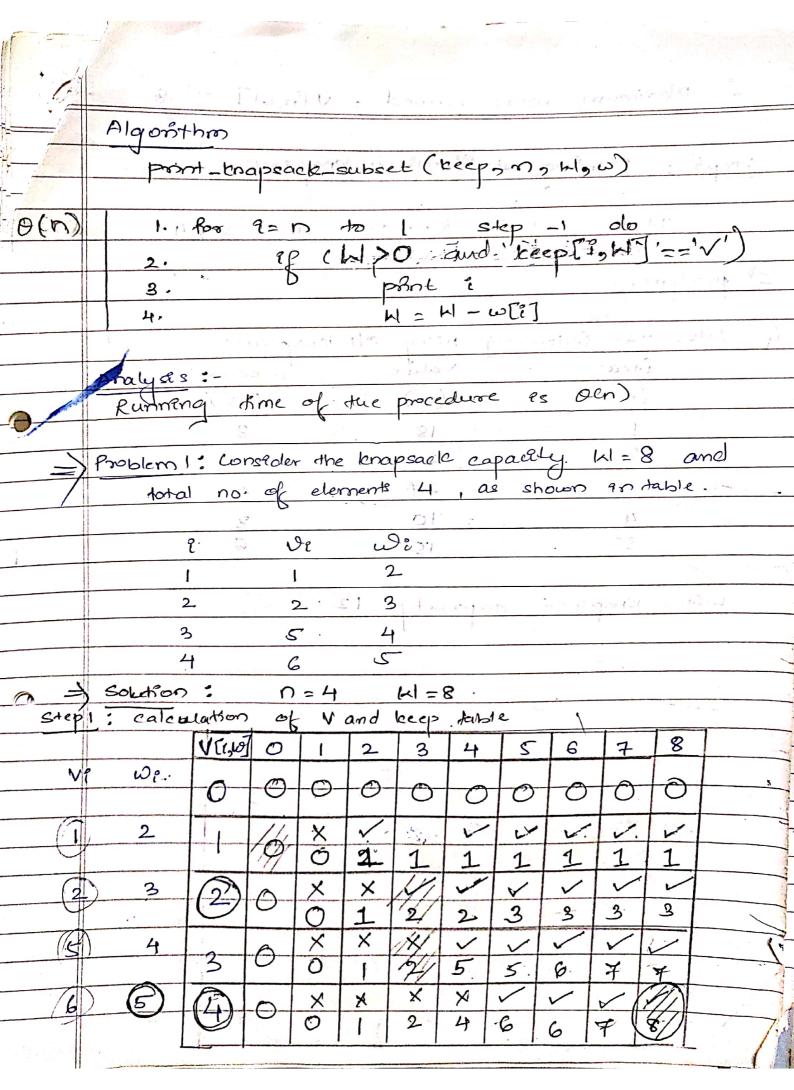

- Recursere step :- To compute V[i,w] where is only 2 possibilities,
  - (1) Leave object i:With objects &1,2...?-13 and storage limit wo,
    V[1,w] = &V[1-1,w].

2 Wall Car

- (ii) Parker object & = Conly possible of we < w)
- After spendeng we seze of knapsack; if we take object i', then bendfit value gained is 'vi'.
